
1.0 Executive Summary

This report summarizes the activities, achievements, and technical progress delivered over the past 10 weeks as an IT employee at **Ultimate General Trading**. The work focused on system development, IT operations, and continuous improvement of the company's ERP platform to support daily business activities across departments.

In my role, I participated in system analysis, user support, feature development, and maintenance of the organization's ERP platform. Key achievements included the development of a desktop ERP application, implementation of a web-based customer data collection module, establishment of an automated data backup mechanism, and foundational work on a new Performance Module. These contributions improved system reliability, usability, and the organization's capacity to support daily business operations.

2.0 Major Achievements and Technical Contributions

2.1 System Analysis and Requirements Gathering

Conducted structured analysis of existing workflows through interviews, observation sessions, and feedback meetings with colleagues across departments. This helped identify bottlenecks, recurring errors, and usability gaps within the ERP system.

2.2 System Improvement Planning

Developed a prioritized improvement plan based on collected feedback, focusing first on critical bug fixes and high-impact enhancements expected to improve operational efficiency and user satisfaction.

2.3 Data Backup and Security Implementation

Designed and implemented an automated backup mechanism to protect organizational data against loss or corruption, thereby strengthening data integrity and business continuity.

2.4 Performance Module Initialization

Commenced foundational work for a new Performance Module, including definition of key performance indicators (KPIs), workflow requirements, and preliminary database schema design.

2.5 Customer Acquisition Integration

Integrated a system for collecting and aggregating customer data from online sources to support marketing activities and sales lead generation.

2.6 ERP Desktop Application Development

Developed a functional desktop version of the web-based ERP to support dedicated

workstation use and improved access for daily users. Continued deployment, version management, and rollout of upgrades and enhancements.

2.7 Training and Support Coordination

Followed up on identified display and usability findings, prepared training materials, and coordinated resources required for effective user training sessions across Sales and Accounting departments.

3.0 10-Week Work Plan (Executed)

Week	Key Activities
1	System review and user feedback collection; aligned on ERP modules, workflows, and IT priorities.
2	Problem analysis and training preparation; prioritized issues and prepared training materials.
3	User training and technical support for Sales and Accounting users.
4	Navigation improvement; analyzed and improved back/return functionality across key modules.
5	Notification feature design for pending approvals and signing tasks.
6	Notification implementation and testing across different user scenarios and roles.
7	Bug fixing and system improvements based on reported issues and user feedback.
8	System maintenance and performance monitoring; reviewed error logs and system response times.
9	User feedback review and final improvements based on post-implementation experience.
10	Final testing, documentation, evaluation, and preparation for management review.

Continuous Activities Throughout the 10 Weeks

- Monitoring system performance and availability.
- Fixing bugs and errors reported by users.
- Providing day-to-day technical support.
- Performing minor system improvements and UI refinements.
- Documenting system changes, issues, and resolutions.
- Collecting feedback for future enhancements.

Overall Objective: To improve system usability, train users effectively, develop requested features, resolve existing problems, and ensure the ERP system remains reliable, secure, and well maintained.

4.0 Challenges and Solutions

Challenge	Solution / Mitigation
Inconsistent user adoption of new features.	Conducted targeted one-on-one follow-up training and prepared simplified user guides (cheat sheets) for key ERP modules.
Identifying the root cause of legacy code errors.	Used debugging tools and collaborated with the senior developer to trace errors back to their source and apply permanent fixes.
Balancing new development with daily support requests.	Prioritized tasks by business impact, documented recurring issues, and scheduled focused development blocks during lower-traffic periods.
Differences between local and production environments.	Aligned development and testing practices more closely with the live server configuration to reduce deployment discrepancies.

5.0 Upcoming Plan and Recommendations

5.1 Immediate Priorities (September 2026)

- **Desktop Application Rollout and Stabilization:** Finalize deployment, monitor stability, and address immediate client-side issues.
- **Performance Module Development:** Move from design to development, including backend data capture and processing.
- **Web Scraper Optimization:** Improve scraping efficiency and schedule automated scraping during off-peak hours.

5.2 Allocation of Funds to Support the IT Department

To sustain and accelerate system development, the IT department requires dedicated budget allocation for application coding, API services, and related infrastructure. Recommended funding areas include:

- **Application Development:** Resources for ongoing ERP enhancements, desktop application maintenance, new module development, and developer tools/licenses required for coding and testing.
- **API Services and Integrations:** Funding for third-party API subscriptions,

cloud/hosting services, integration platforms, and secure connectivity needed to support customer data collection, notifications, and external system links.

- **IT Infrastructure and Support:** Backup storage, staging/production server capacity, security tools, and technical resources to keep systems stable as usage grows across departments.

Allocating funds to these areas will enable the IT team to deliver improvements faster, reduce downtime, and support the company's digital operations with greater reliability.
